SUMMARY

Third-year IT student at HUFLIT with a strong passion for mobile development (Flutter & native Android/Java). I enjoy building real apps that integrate AI/NLP, WebSocket, and RESTful backends, and I'm eager to learn and grow as a mobile developer in a professional environment. My actions are always aimed at achieving high results and ensuring the quality fulfillment of every task I take on.

SKILLS

Programming Languages: Dart, Java, JavaScript, C#, SQL

Frameworks: Flutter, Android SDK, ASP.NET Core

Developer Tools: Git, Android Studio, Gradle, Postman, VS Code, VS Studio, NetBeans, Firebase

Cloud & Deployment: Firebase (Auth, Cloud Messaging), Render, Vercel

Database: SQL Server, PostgreSQL

Languages: English (Read & Understand Technical Documents / Basic Communication), Vietnamese (Native)

EDUCATION

Ho Chi Minh City University of Foreign Languages - Information Technology

Oct 2023 - present

- GPA: 3.4/4.0
- Expected graduation: January 2027

ACADEMIC PROJECTS

FloodAid | Android Developer (Flutter)

May 2026 - Aug 2026

AI/NLP-based platform for coordinating flood relief in Central Vietnam

[\[Demo APK\]](#) · [\[GitHub\]](#)

- Developed 2 Android apps in Flutter/Dart (victim and volunteer) with role-based navigation and a layered architecture, plus an admin web client.
- Built an on-device dialect normalizer in Dart using an offline dictionary of about 26,000 entries and a longest-match algorithm; the dictionary is bundled as JSON and cached in SharedPreferences, and runs fully offline.
- Added voice SOS with speech-to-text and integrated a Google Gemini assistant to interpret rescue requests.
- Implemented real-time rescue tracking and chat over WebSocket, with push notifications via Firebase Cloud Messaging.
- Integrated maps and GPS (flutter_map, latlong2, Geolocator, VietMap) with live distance and ETA.
- Implemented eKYC identity verification (camera, image_picker, CCCD).
- Consumed 43 RESTful API endpoints from a self-built Node.js/Express backend over PostgreSQL/PostGIS (9 tables), secured with JWT authentication.

OnlineFoodShop - Food Ordering App | Android Developer

Feb 2025 - Apr 2025

- Built a native Android food-ordering app with two role-based experiences (customer and admin), covering product browsing, cart, COD checkout, and a 5-state order lifecycle, plus an admin console with 7 full CRUD modules.
- Consumed 25 RESTful API endpoints via Retrofit2 + Gson from a self-built Node.js/Express backend deployed on Render, with role-based navigation and session persistence in SharedPreferences.
- Integrated Google Sign-In (OAuth drive.file) with the Google Drive API to upload and publicly serve product images.

QuanLiTruyen - Manga Reader App | Android Developer

Jun 2025 - Jul 2025

- Built an offline-first native Android manga reader that imports .cbz archives (ZipInputStream on a background executor) and auto-generates chapters by distributing extracted pages across a user-defined chapter count.
- Developed a ViewPager2 reader with dual reading modes and three Glide image-quality tiers, plus a statistics dashboard rendering aggregated SQL results as Chart.js charts in a WebView.
